

Abstract of the Disclosure

An improved sound quality box call. The box call comprises a box and a paddle. The box has a pair of longitudinal walls, a sounding chamber between the walls, and a pair of longitudinally extending upper arcuate edges on the walls respectively. The paddle has a lower surface for engaging the edges for making sounds. The paddle lower surface is longitudinally arcuate and has a contour longitudinally which desirably conforms substantially to the contour longitudinally of the arcuate side wall edges, which allows increased length of contact between the paddle and box side walls whereby to produce a more realistic yelp and better sound quality in both pitch and volume.
